

Submission LINALG1-FINAL-SUB03

Question LINALG1-FINAL-Q01

started with a familiar rule, but the key condition is wrong:

$$\det = 6(6) - 4(4) = 20$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q02

started with a familiar rule, but the key condition is wrong:

$$\det(A) = 2 \cdot 6 - 2 \cdot 2 = 8$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q03

started with a familiar rule, but the key condition is wrong:

$$T(1, -1) = (1 - 2, 3 + 1) = (-1, 4)$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q04

started with a familiar rule, but the key condition is wrong:

$$\text{Set } c \blacksquare(1, 0) + c \blacksquare(0, 1) = (0, 0).$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q05

started with a familiar rule, but the key condition is wrong:

$\text{Null}(A)$ is the set of vectors sent to the zero vector.

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q06

started with a familiar rule, but the key condition is wrong:

$$\det = 6(6) - 1(4) = 32$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q07

started with a familiar rule, but the key condition is wrong:

$$\det(A) = 4 \cdot 4 - 2 \cdot 2 = 12$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q08

started with a familiar rule, but the key condition is wrong:

$$T(1, -1) = (1 - 2, 3 + 1) = (-1, 4)$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q09

started with a familiar rule, but the key condition is wrong:

Set $c_1(1,0)+c_2(0,1)=(0,0)$.

I treated variables/constraints as independent, so this conclusion is not justified.

Question LINALG1-FINAL-Q10

started with a familiar rule, but the key condition is wrong:

$\text{Null}(A)$ is the set of vectors sent to the zero vector.

I treated variables/constraints as independent, so this conclusion is not justified.
