

Submission MICRO1-FINAL-SUB03

Question MICRO1-FINAL-Q01

started with a familiar rule, but the key condition is wrong:

$$44 - 4P = 7 + P \Rightarrow P^* = (44 - 7) / (4 + 1) = 7.40$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q02

started with a familiar rule, but the key condition is wrong:

$$\% \Delta Q = -4/38.0$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q03

started with a familiar rule, but the key condition is wrong:

Shift the wedge between buyer and seller prices by t .

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q04

started with a familiar rule, but the key condition is wrong:

$SMC = PMC + \text{marginal external cost}$, so SMC lies above PMC .

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q05

started with a familiar rule, but the key condition is wrong:

At the ceiling, Q_d exceeds Q_s .

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q06

started with a familiar rule, but the key condition is wrong:

$$31 - 5P = 8 + P \Rightarrow P^* = (31 - 8) / (5 + 1) = 3.83$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q07

started with a familiar rule, but the key condition is wrong:

$$\% \Delta Q = -2/19.0$$

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q08

started with a familiar rule, but the key condition is wrong:

Shift the wedge between buyer and seller prices by t .

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q09

started with a familiar rule, but the key condition is wrong:

$SMC = PMC + \text{marginal external cost}$, so SMC lies above PMC.

I treated variables/constraints as independent, so this conclusion is not justified.

Question MICRO1-FINAL-Q10

started with a familiar rule, but the key condition is wrong:

At the ceiling, Q_d exceeds Q_s .

I treated variables/constraints as independent, so this conclusion is not justified.
