

Submission PY1-FINAL-SUB03

Question PY1-FINAL-Q01

started with a familiar rule, but the key condition is wrong:

`range(6)` gives 0 through 5

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q02

started with a familiar rule, but the key condition is wrong:

`counts = Counter(xs)`

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q03

started with a familiar rule, but the key condition is wrong:

A single pass fixes only adjacent inversions encountered once.

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q04

started with a familiar rule, but the key condition is wrong:

linear scan: up to 64 comparisons, $\Theta(n)$

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q05

started with a familiar rule, but the key condition is wrong:

Removing shifts later elements left while the iterator advances.

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q06

started with a familiar rule, but the key condition is wrong:

`range(5)` gives 0 through 4

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q07

started with a familiar rule, but the key condition is wrong:

`counts = Counter(xs)`

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q08

started with a familiar rule, but the key condition is wrong:

A single pass fixes only adjacent inversions encountered once.

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q09

started with a familiar rule, but the key condition is wrong:

linear scan: up to 64 comparisons, $\Theta(n)$

I treated variables/constraints as independent, so this conclusion is not justified.

Question PY1-FINAL-Q10

started with a familiar rule, but the key condition is wrong:

Removing shifts later elements left while the iterator advances.

I treated variables/constraints as independent, so this conclusion is not justified.
